Performance targets

Measure GET / health, public FAQ list/detail/search, auth requests, owner-protected mutations, and Gemini-backed requests. Report AI latency separately from local API/database latency.

Suggested method

Use isolated test database and synthetic content. Record dataset size, concurrency, request count, median and percentile latency, throughput, status/error rate, and model/provider for AI calls.

Available test assets

test_api.js defines a sequential integration workflow for health, registration, duplicate registration, login, profile, FAQ create/list/detail/invalid ID/search/update/delete, and both AI routes. It also cleans up test records.

AI result behavior

The script accepts successful generated content when credentials work, or a formatted failure response when they do not. This describes the script's checks, not an execution result.

Evidence boundary

No benchmark output or completed run transcript was provided. No performance numbers are asserted.
